

**ABSTRACT OF THE DISCLOSURE**

1. The present invention is intended to simplify  
2 operation of a folding type portable communication  
3 device 1 in making a switch or selection between a calling  
4 reception vibration mode and a calling reception sound  
5 mode. The device 1 has two communication units 2 and 3.  
6 A two-level switch 4 can detect an unfolded position or  
7 a folded position of the communication units 2 and 3,  
8 causing a mode selector 5 to select a calling reception  
9 vibration mode or a calling reception sound mode. The  
10 mode selector 5 has a first circuit 14 for driving a  
11 vibrator 6 and a second circuit 15 for driving a sounder  
12 7. The mode selector 5 has a controller 16. The  
13 controller 16 energizes one of the first and second  
14 circuits 14 and 15 in response to the selected mode upon  
15 reception of a calling.
